

# Extension of the CREW-type Analysis to VIIRS

Andrew Heidinger, Andi Walther, Yue Li and Denis Botambekov  
NOAA/NESDIS and UW/CIMSS, Madison, WI, USA

*CREW-4 Grainau, Germany, March 2014*

# Motivation

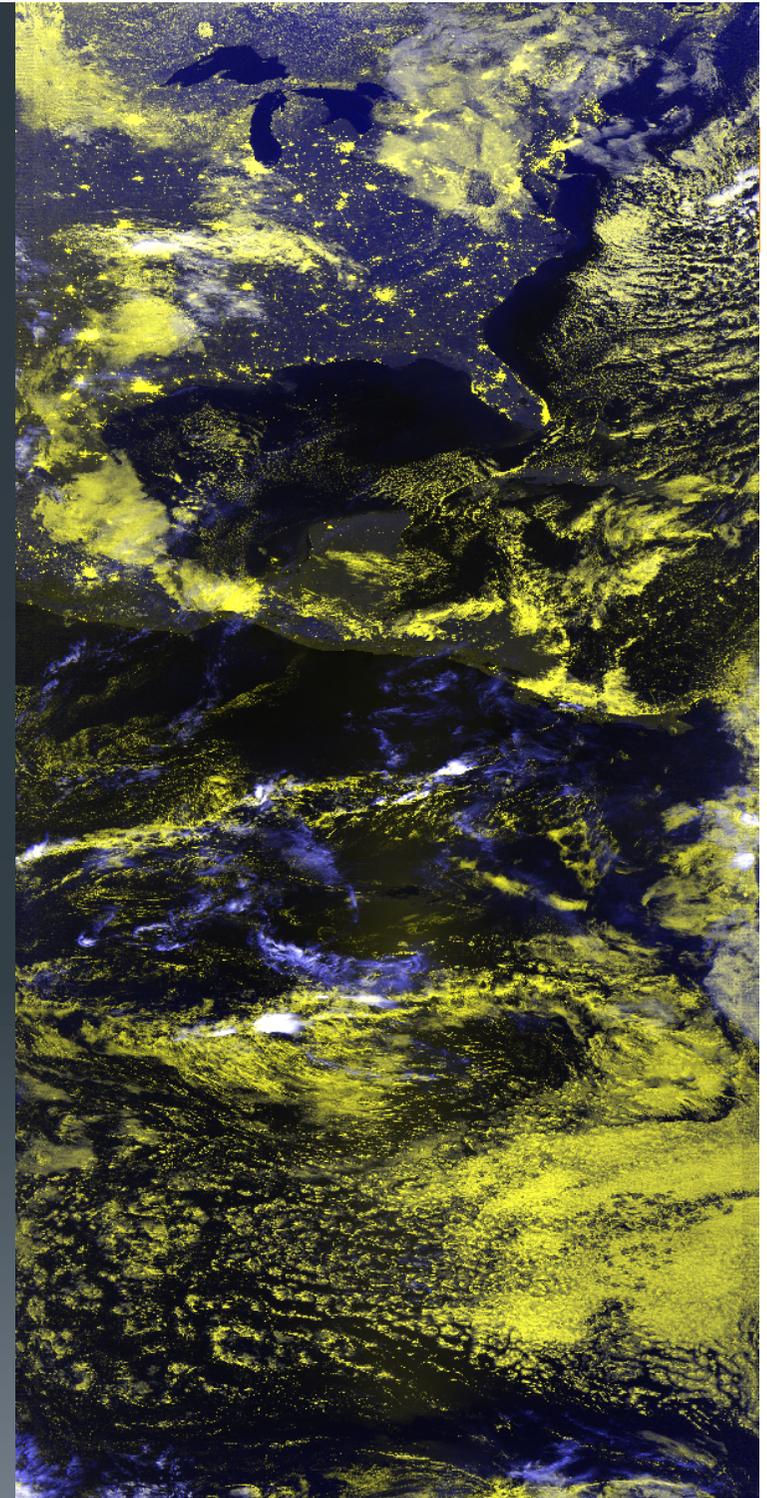

- Important time in VIIRS cloud products. Almost all operational agencies are getting ready to official release VIIRS cloud products.

# Goals

- Conduct a comparison of VIIRS Cloud Products like was done for SEVIRI in past CREW Workshops.
- Facilitate discussions between VIIRS algorithm developers.
- Only a sample of results shown here, full results are available.

# The VIIRS Sensor

- Launched by NASA on the Suomi-NPP Mission in 2011 (right after CREW3). Will be the operational NOAA polar imager.
- VIIRS offers a nearly full complement of solar reflectance channels but provides only the 8.5, 11 and 12  $\mu\text{m}$  channel in the Far-IR.
  - *Many multi-layer and cloud-height approaches developed with MODIS don't apply.*
- The most unique feature of VIIRS is the Day/Night Band (DNB) which offers well-calibrated and very sensitive observations of lunar reflectance. Image on left shows a DNB-DNB-11 $\mu\text{m}$  (rev) false color image from Mar 29, 2012.
- VIIRS M-bands have a spatial resolution of 750m that grows in size with angle but only by a factor of 2.
- VIIRS I-bands provide multiple channels at 375 m.
- Several groups are working on CrIS + VIIRS data sets.

# Data Providers

- **IDPS** = Official VIIRS cloud products developed by Private Industry for the JPSS program.
- **CLAVR-x = NOAA Algorithms (aka PATMOS-x)**
  - **DCOMP** = optical depth and particle size algorithm in CLAVR-x
  - **ACHA** = cloud height algorithm in CLAVR-x
- **MODAWG** = The NASA GSFC MODIS + NOAA AWG suite of VIIRS cloud products
- **PPS** = Polar Platform System from SMHI and NWCSAF
  - **CPP** = cloud optical depth and particle size in PPS
- **LARC** = NASA LaRC VIIRS products

# Data

- 5 scenes chosen to be co-located with A-train. 3 day / 2 night
- 4 scenes chosen to fall within SEVIRI domain for future comparison
- Each scene is approximately 20 minutes in length (1/4 orbit)
- Night scenes chosen to have good lunar viewing conditions.

## What is a CREW-type Analysis

- Pixel-level comparisons of mask, phase, height, optical depth and particle size.
- Images showing the controversial pixels
- The  $N \times N$  matrix of scatter-plots.
- A document is available with all results.

*For this talk, we'll show only subset of results.*

# CLOUD MASK COMPARISON

# September 26, 2013 (Daytime)

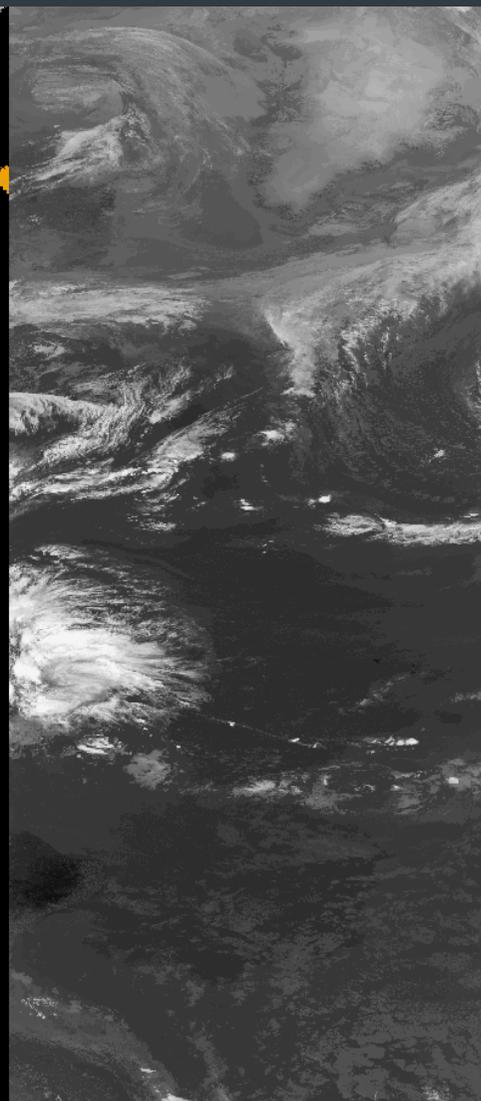

Land Class

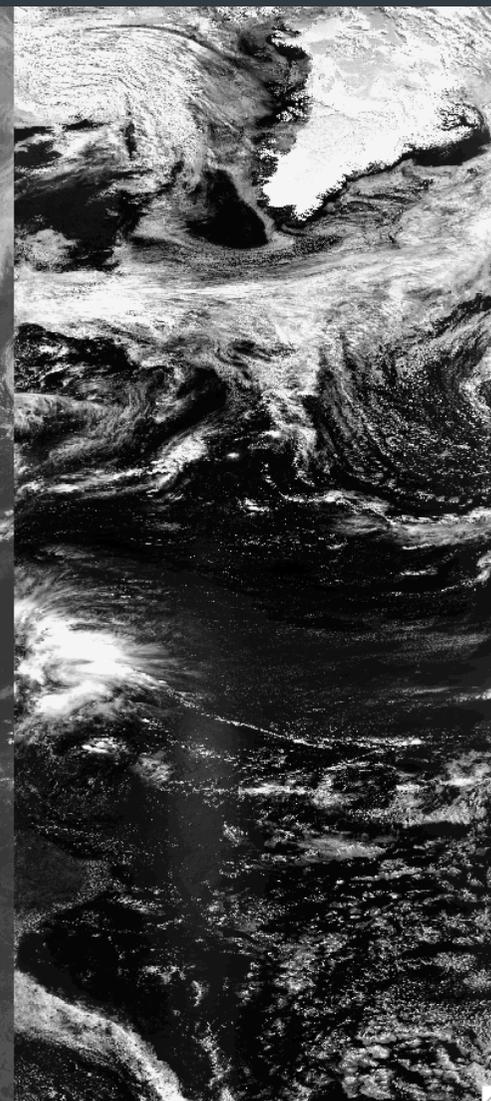

Snow Class

11  $\mu\text{m}$  B.T (K)

0.65  $\mu\text{m}$  Refl. (%)

# Cloud Mask Comparison (09/26 Day)

0.65  $\mu\text{m}$  Refl .

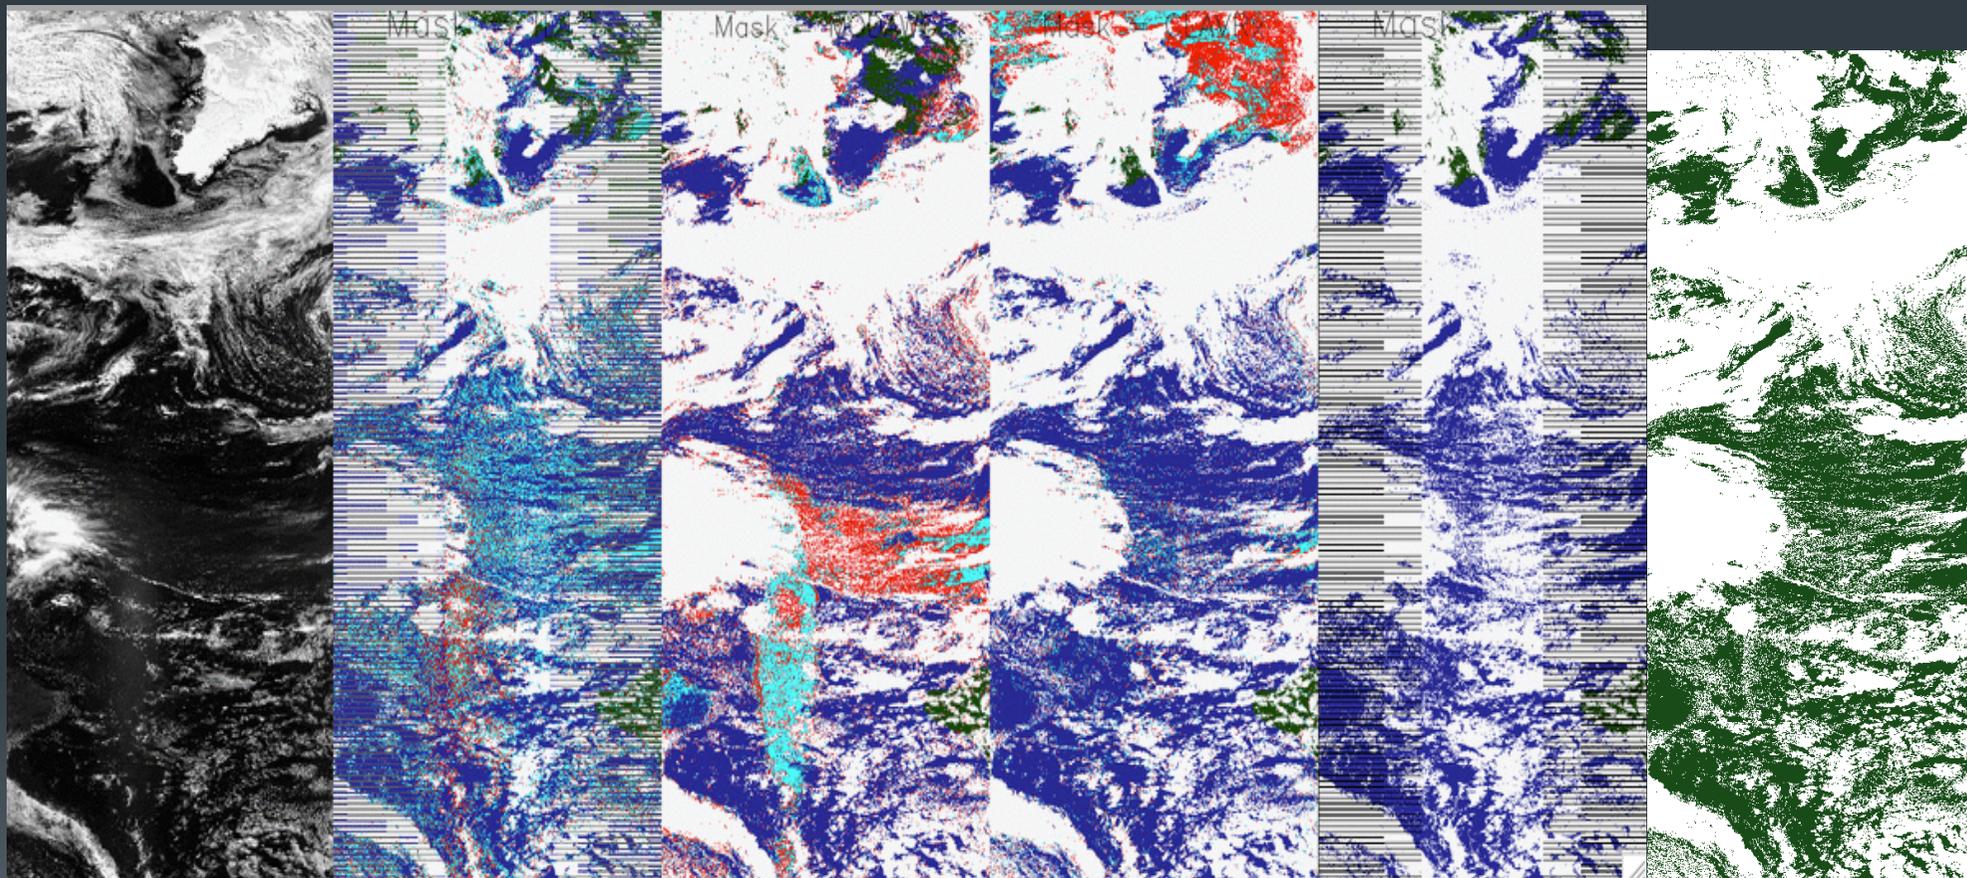

IDPS

MODAWG

CLAVR-x

PPS

LARC

Cloud Mask

# Cloud Phase Comparison (09/26 Day)

10

11  $\mu\text{m}$  BT.

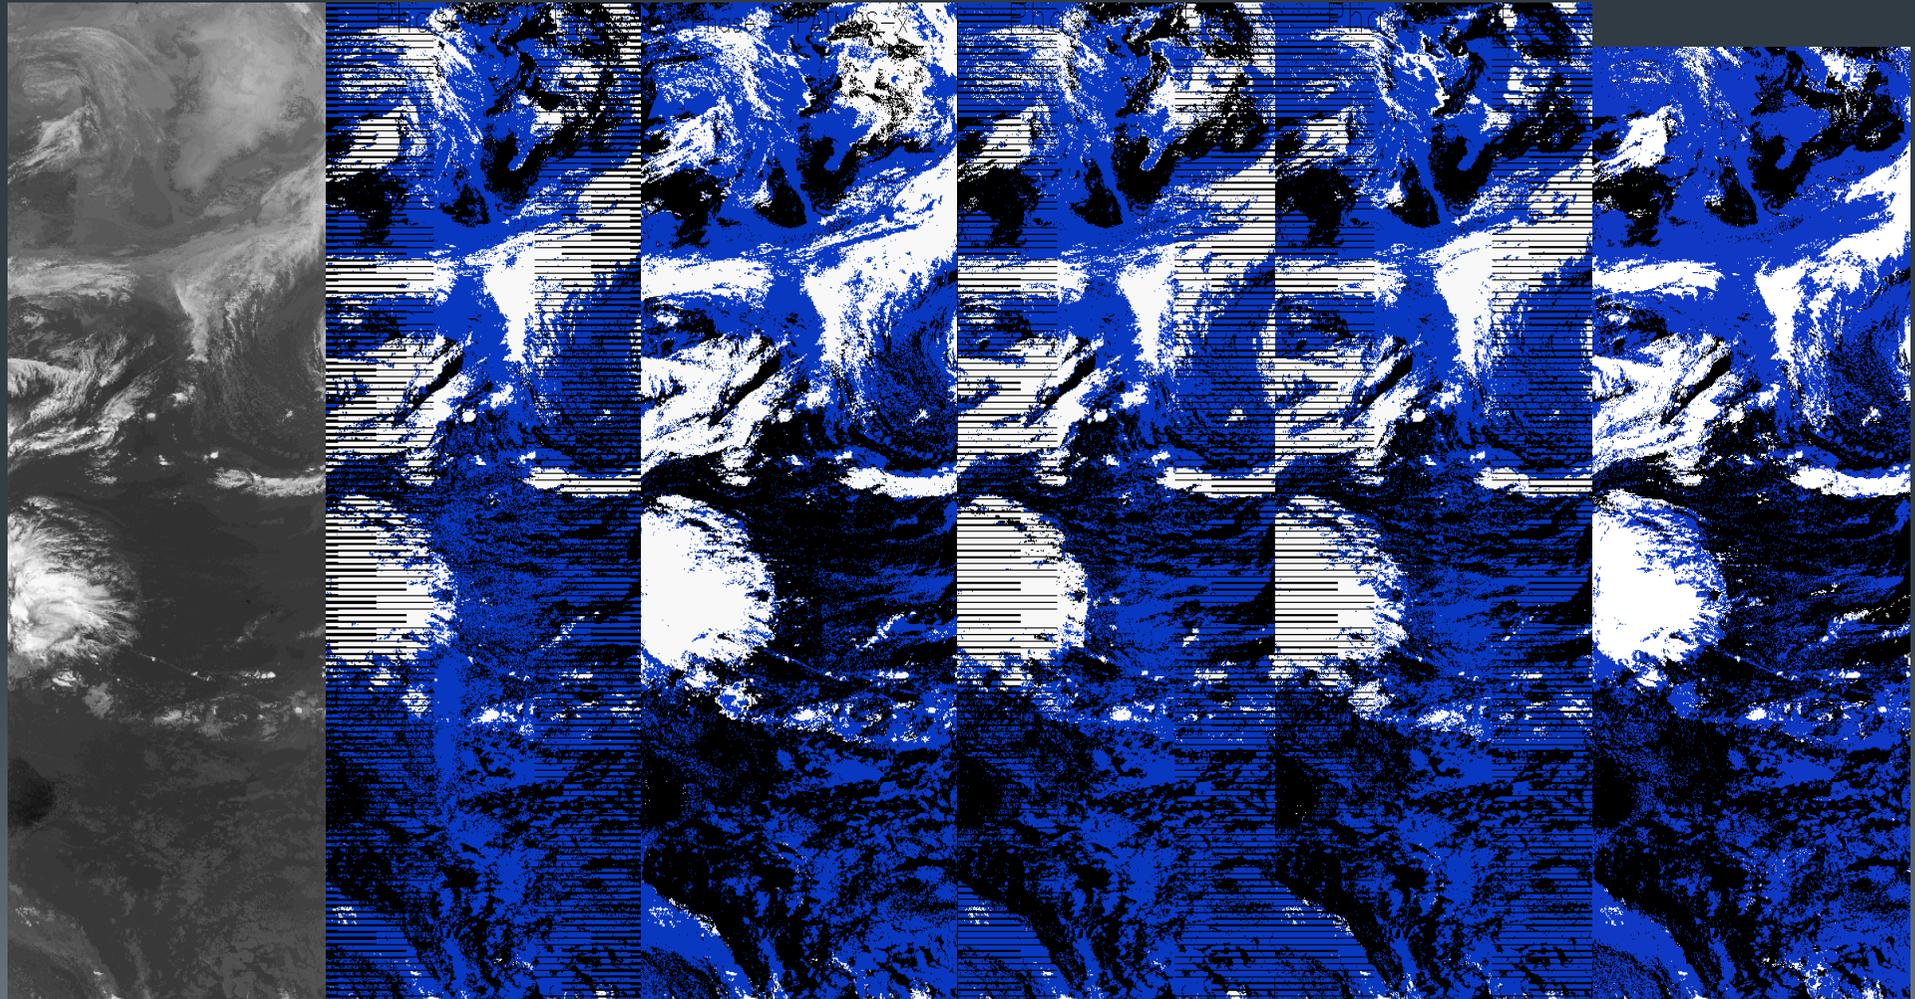

IDPS

CLAVR-x

CPP

PPS

LARC

black = clear / blue = water / white = ice

# CLOUD OPTICAL DEPTH COMPARISON

# Cloud Optical Depth 09/26

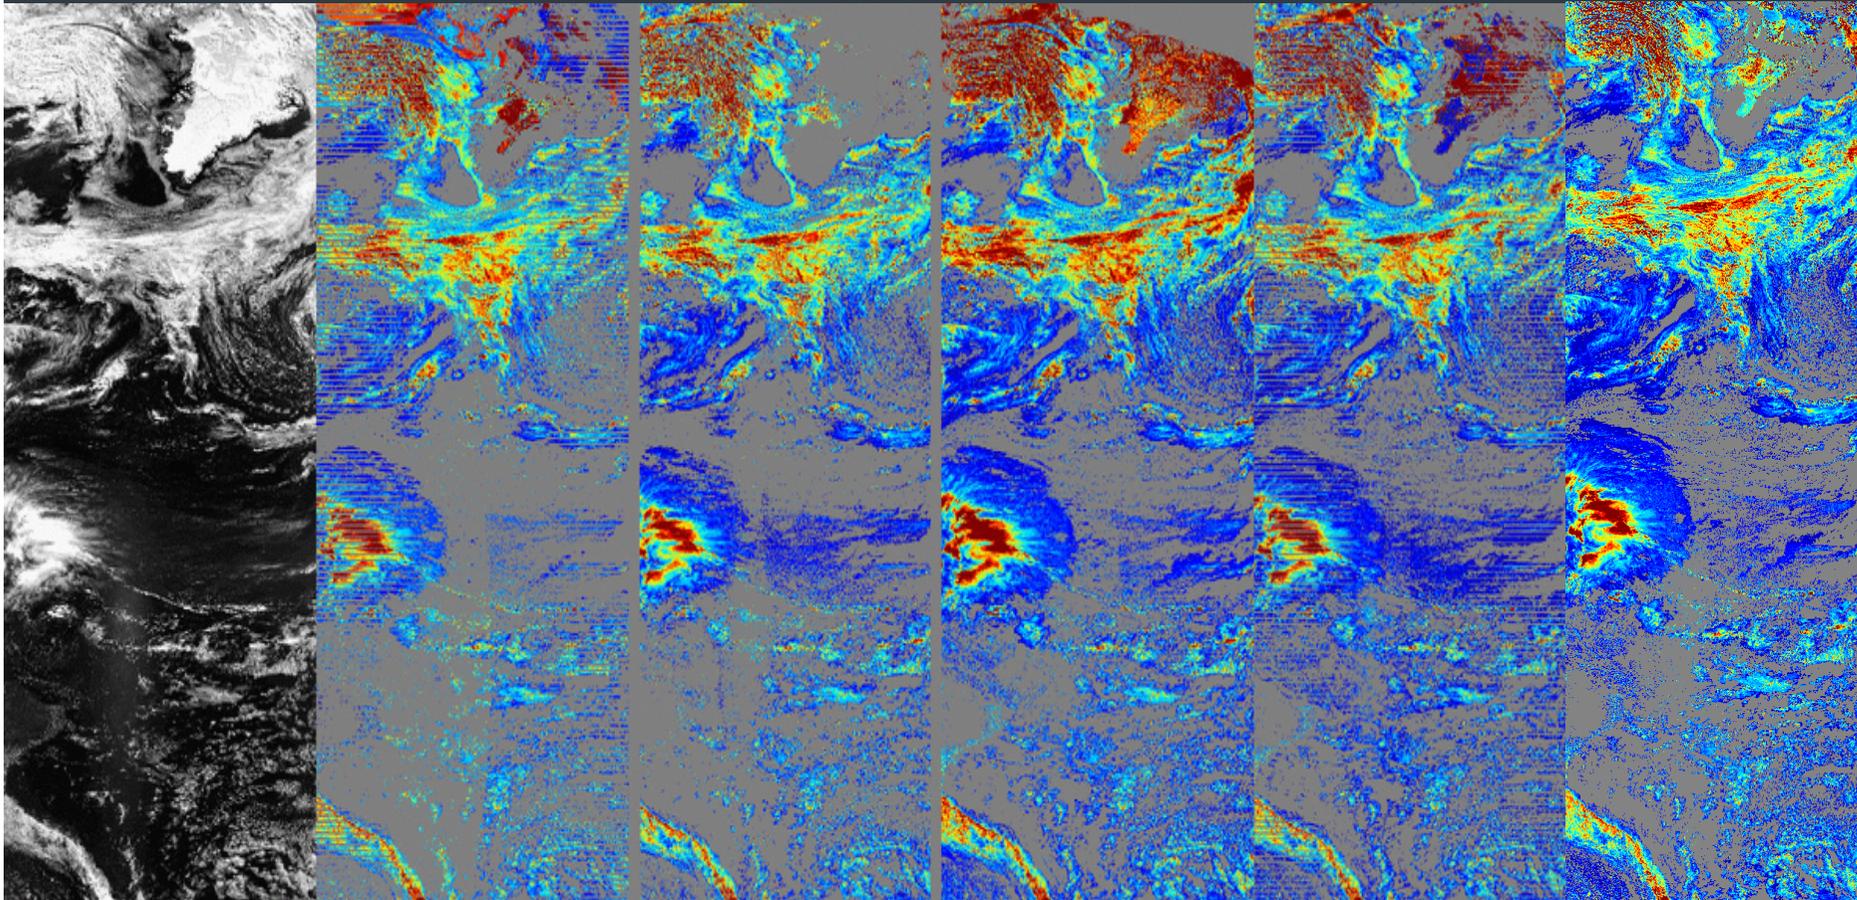

0.65  $\mu\text{m}$

IDPS

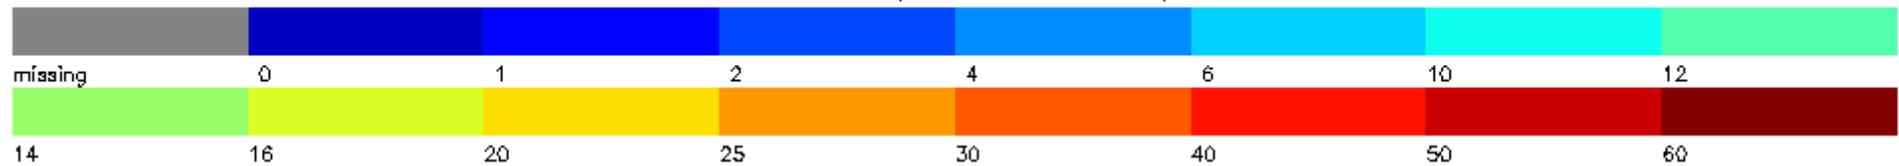

GSFC

CLAVR-x/DCOMP PPS/CPP

LARC

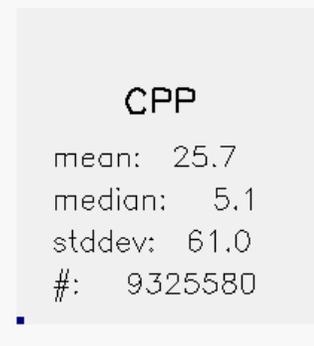

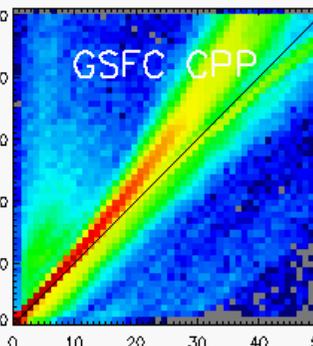

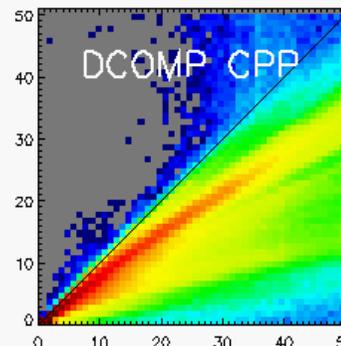

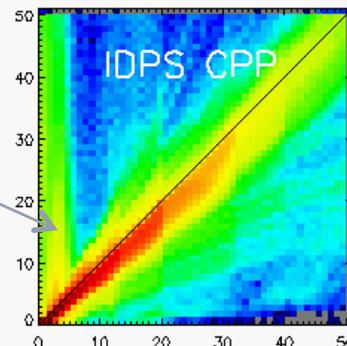

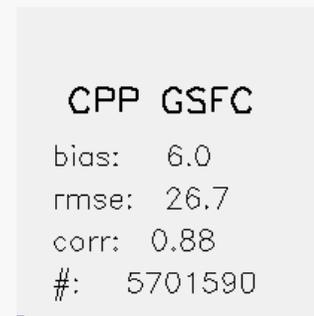

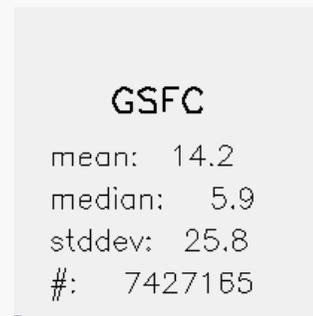

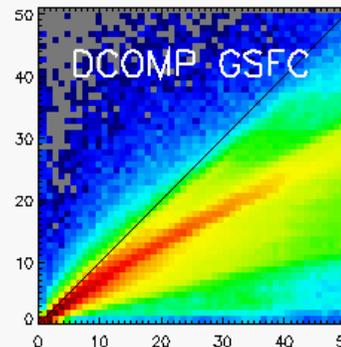

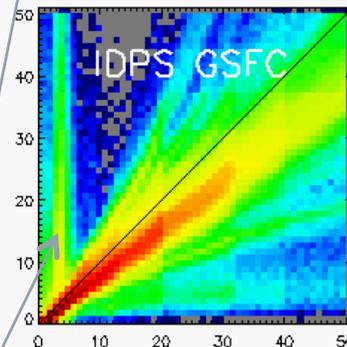

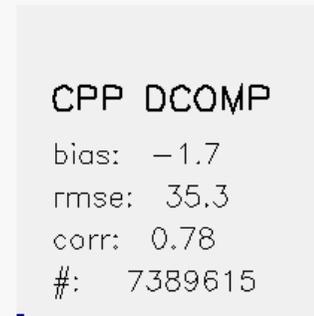

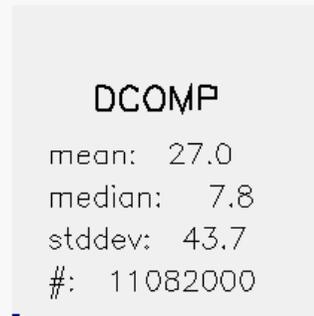

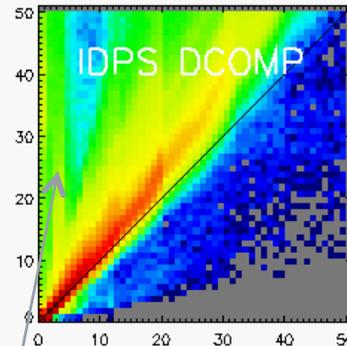

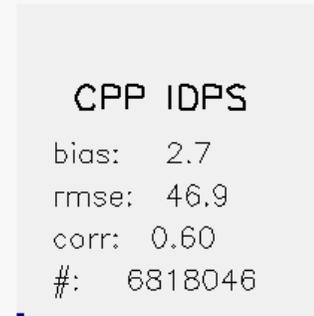

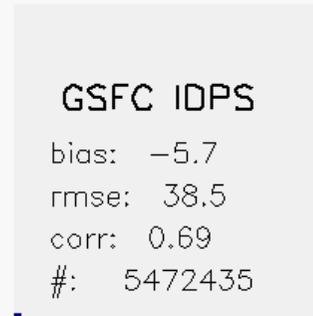

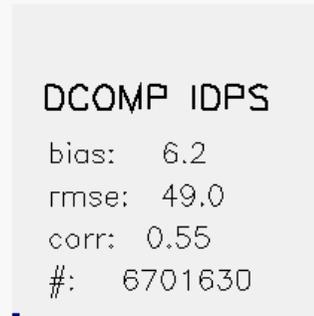

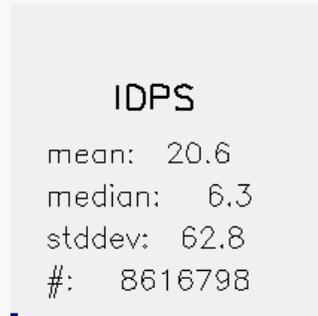

Cloud Optical Depth

# Cld. Optical Depth Ice Phases 09/26

- Less agreement than water (expected)
- Highest correlation is GSFC and CPP.
- Lowest correlation is DCOMP and IDPS.
- DCOMP shows largest bias.
- IDPS shows low values for a wide range of values of other data.

# CLOUD PARTICLE SIZE COMPARISON

# Cloud Effective Radius (09/26)

Comparison for September 26, 2013

0.65  $\mu\text{m}$

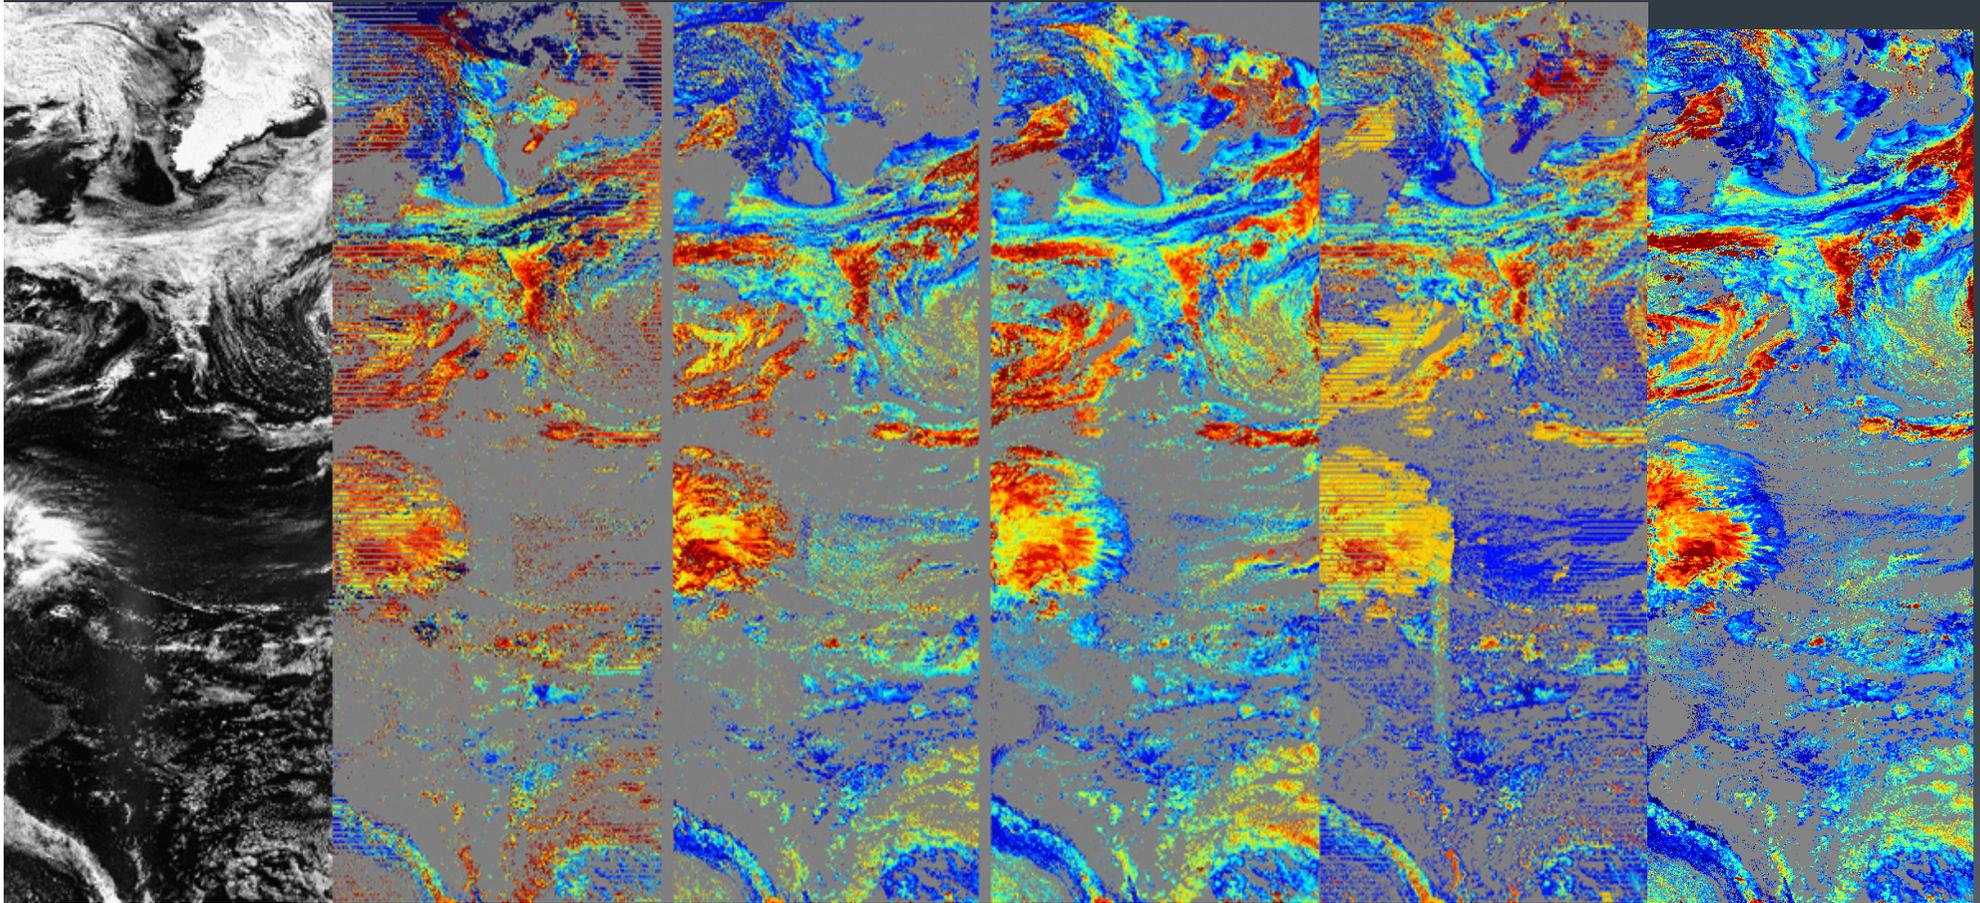

IDPS

GSFC

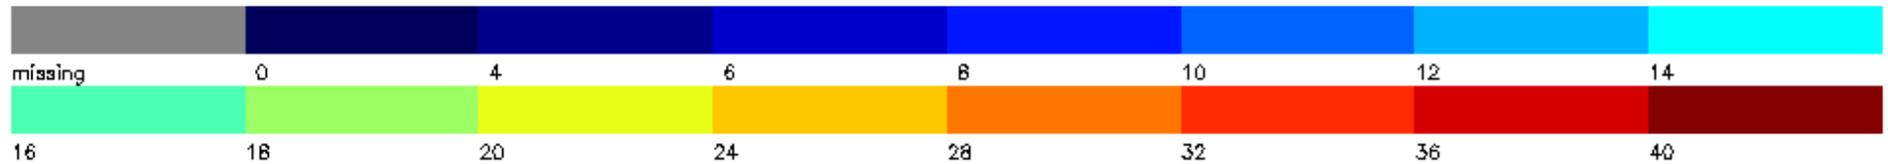

CLAIR-x/DCOMP

PPS/CPP

LARC

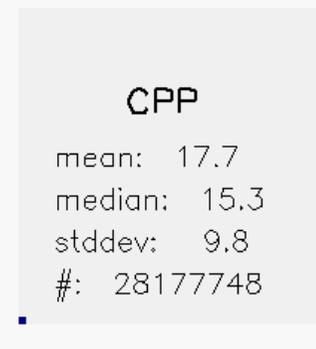

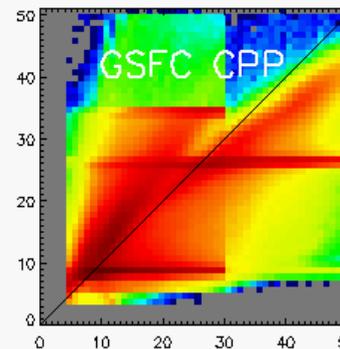

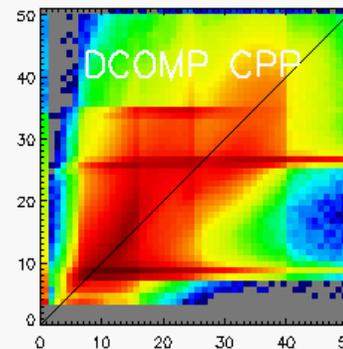

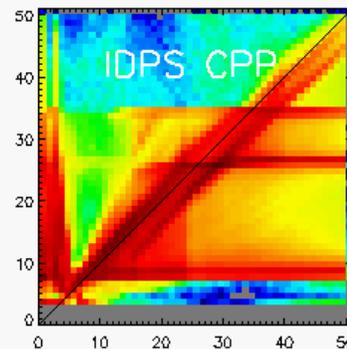

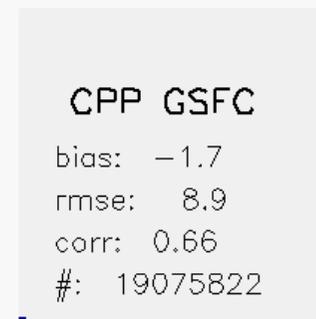

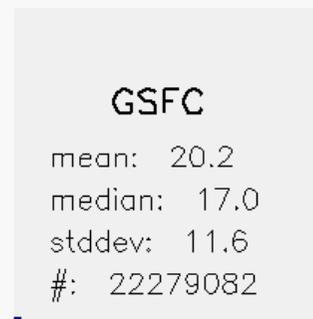

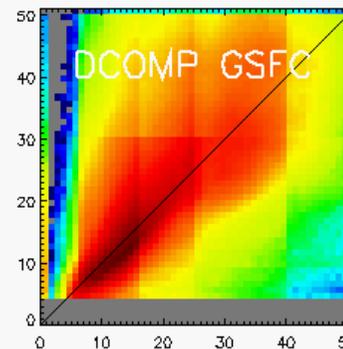

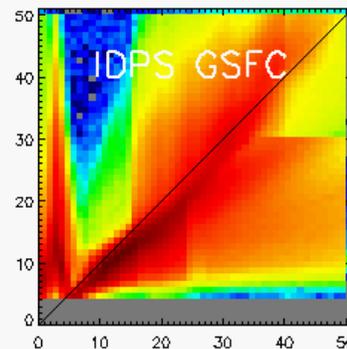

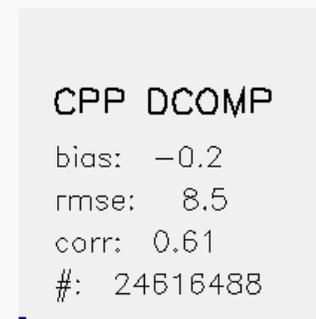

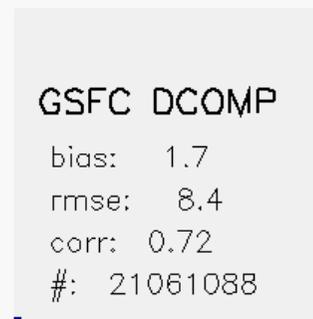

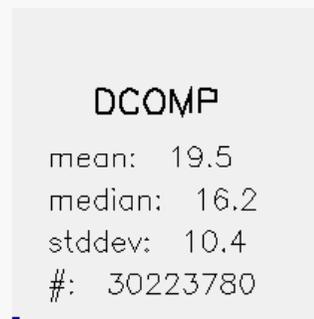

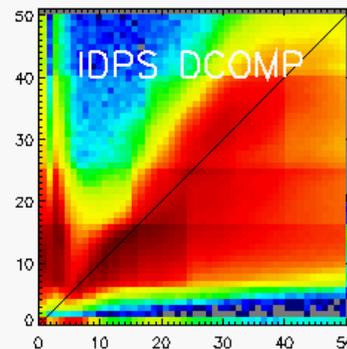

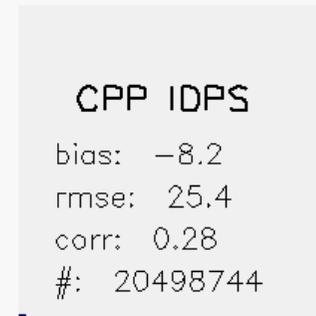

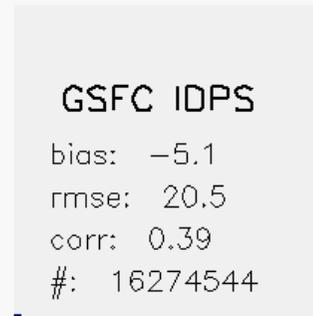

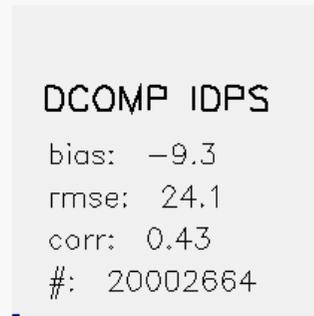

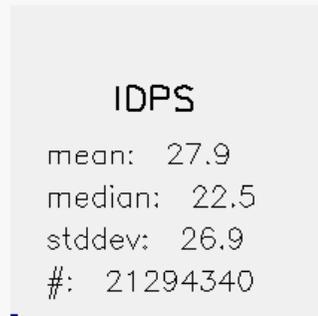

Cloud Effective Radius (micron)

# Cld. Particle Size All Phases 09/26

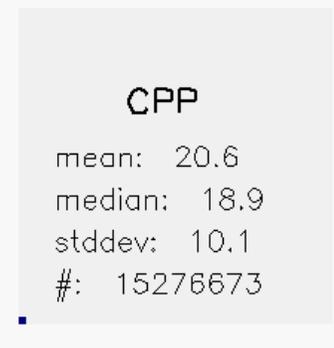

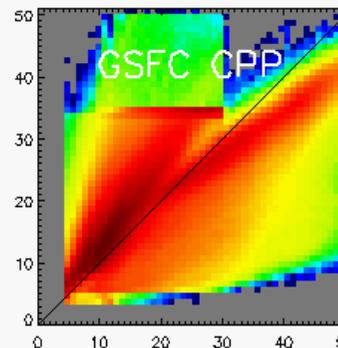

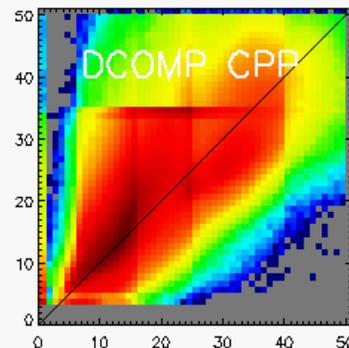

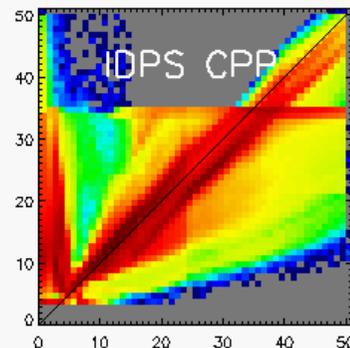

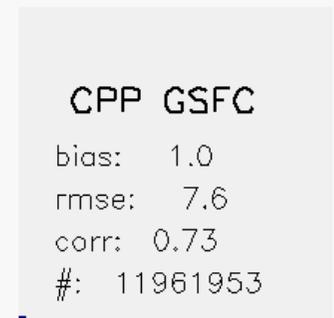

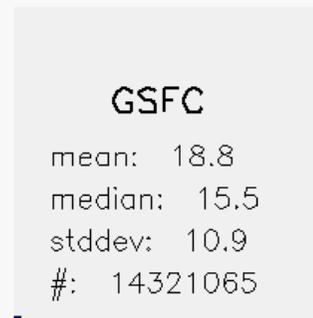

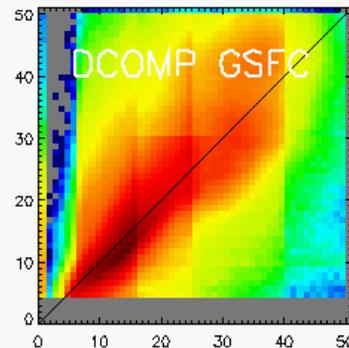

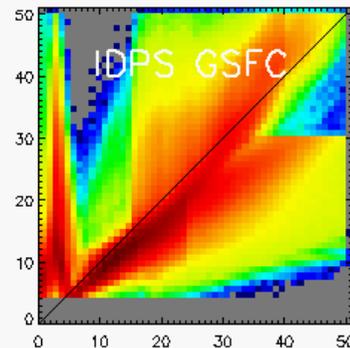

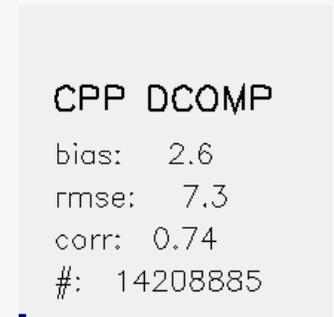

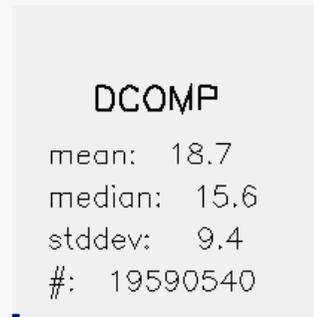

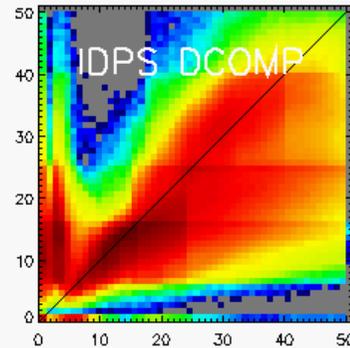

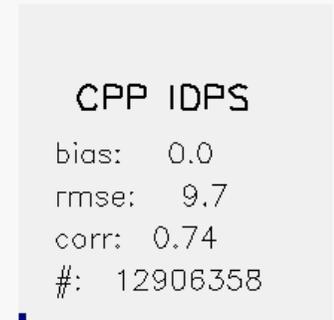

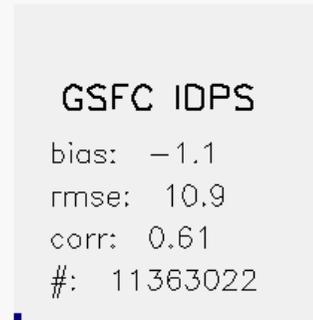

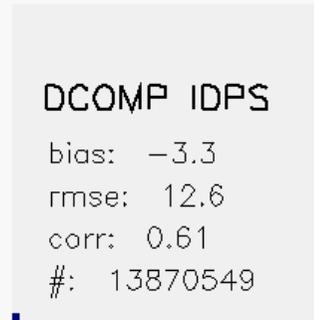

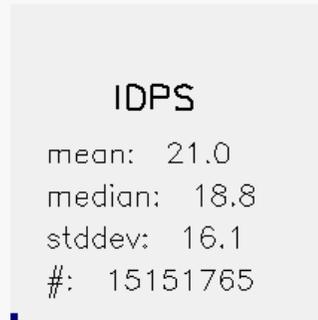

- Small particle mode for IDPS apparent.
- CPP shows preferred values
- Highest correlation GSFC and DCOMP
- Lowest correlation CPP and IDPS
- Lowest numbers are for IDPS
- Highest numbers for DCOMP.

# Cld. Particle Size All Phases 09/26

## Cld Opd > 4

- These results show impact of removing cloud optical depth < 4.
- CPP artifacts largely disappear.
- IDPS artifacts remain.
- This means IDPS is not converging for clouds with optical depth > 4 because QF filter removes them.

# CLOUD HEIGHT COMPARISON

# March 29, 2013 (Nighttime)

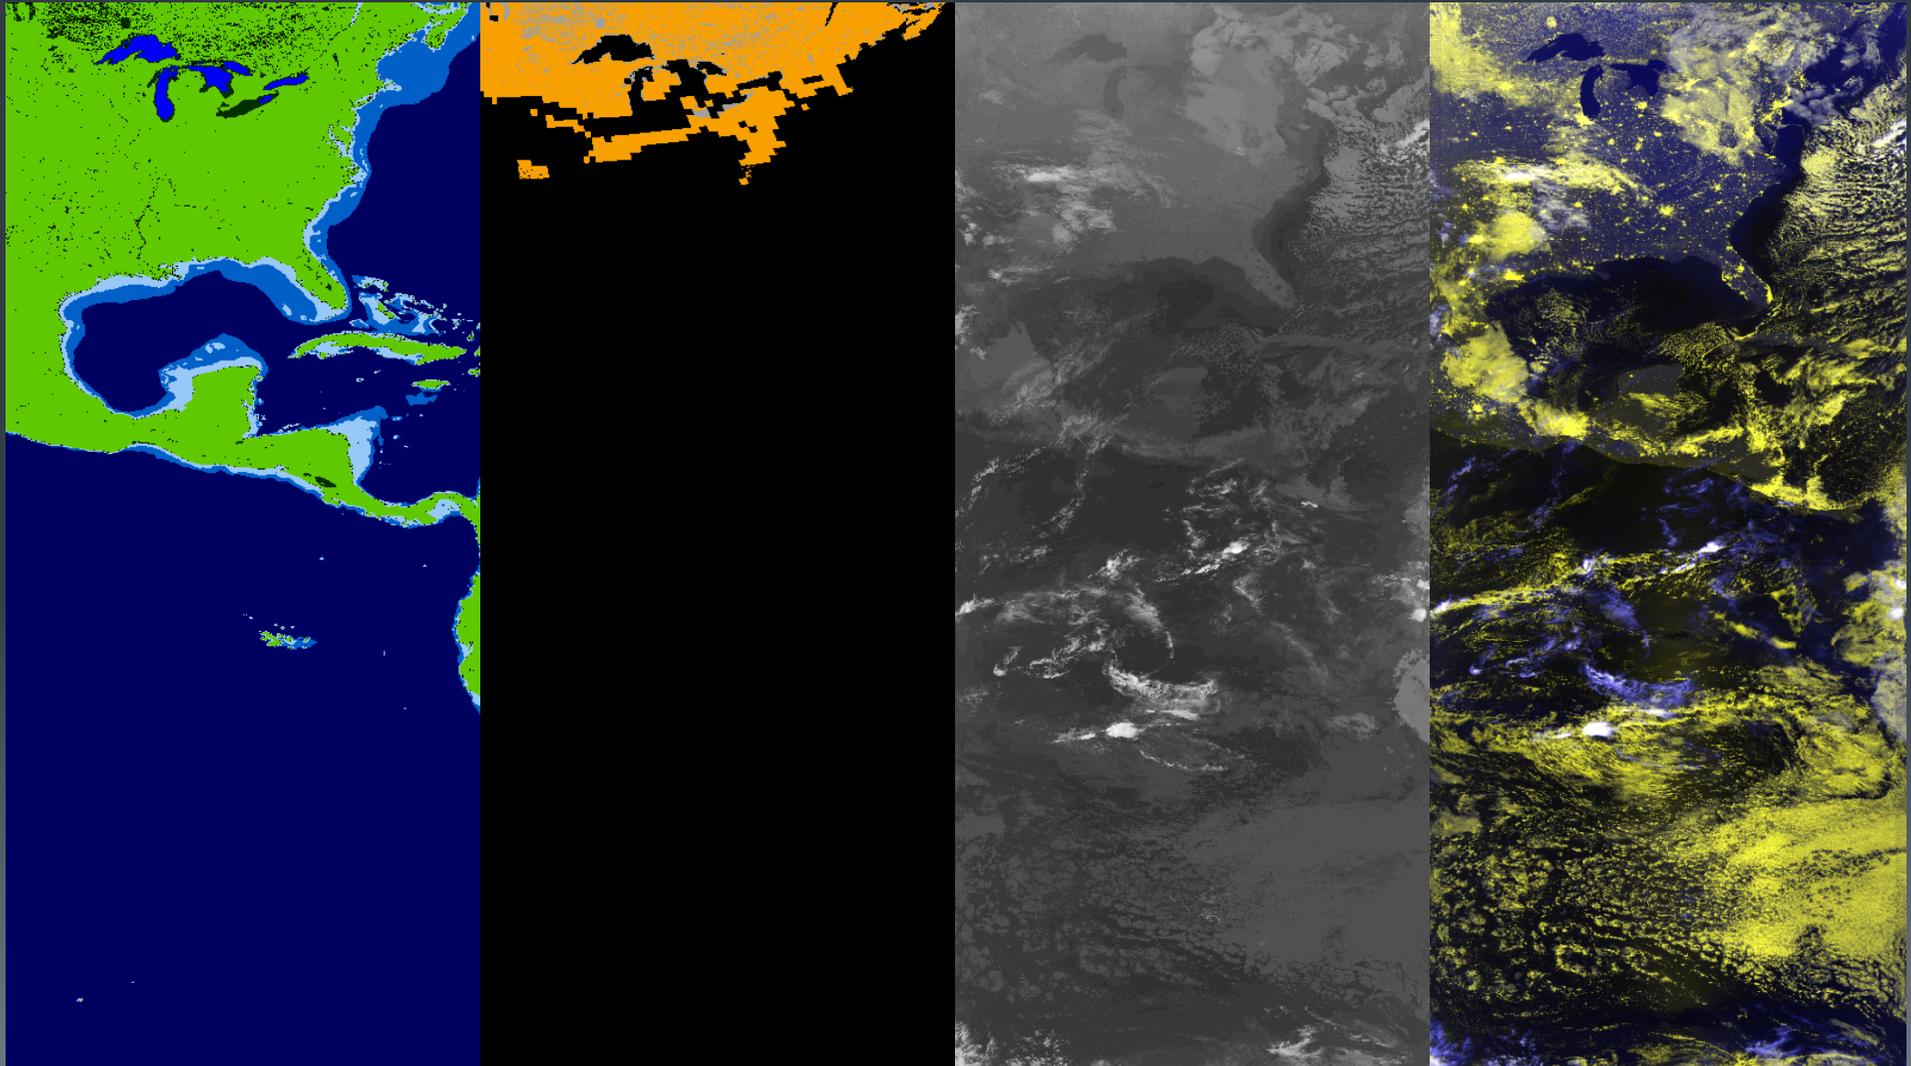

Cloud Height Comparisons using CALIPSO shown for this Scene

Land Class

Snow Class

11  $\mu\text{m}$  BT (K)

DNB + 11  $\mu\text{m}$  RGB

# Cloud Height Comparison 03/29

20

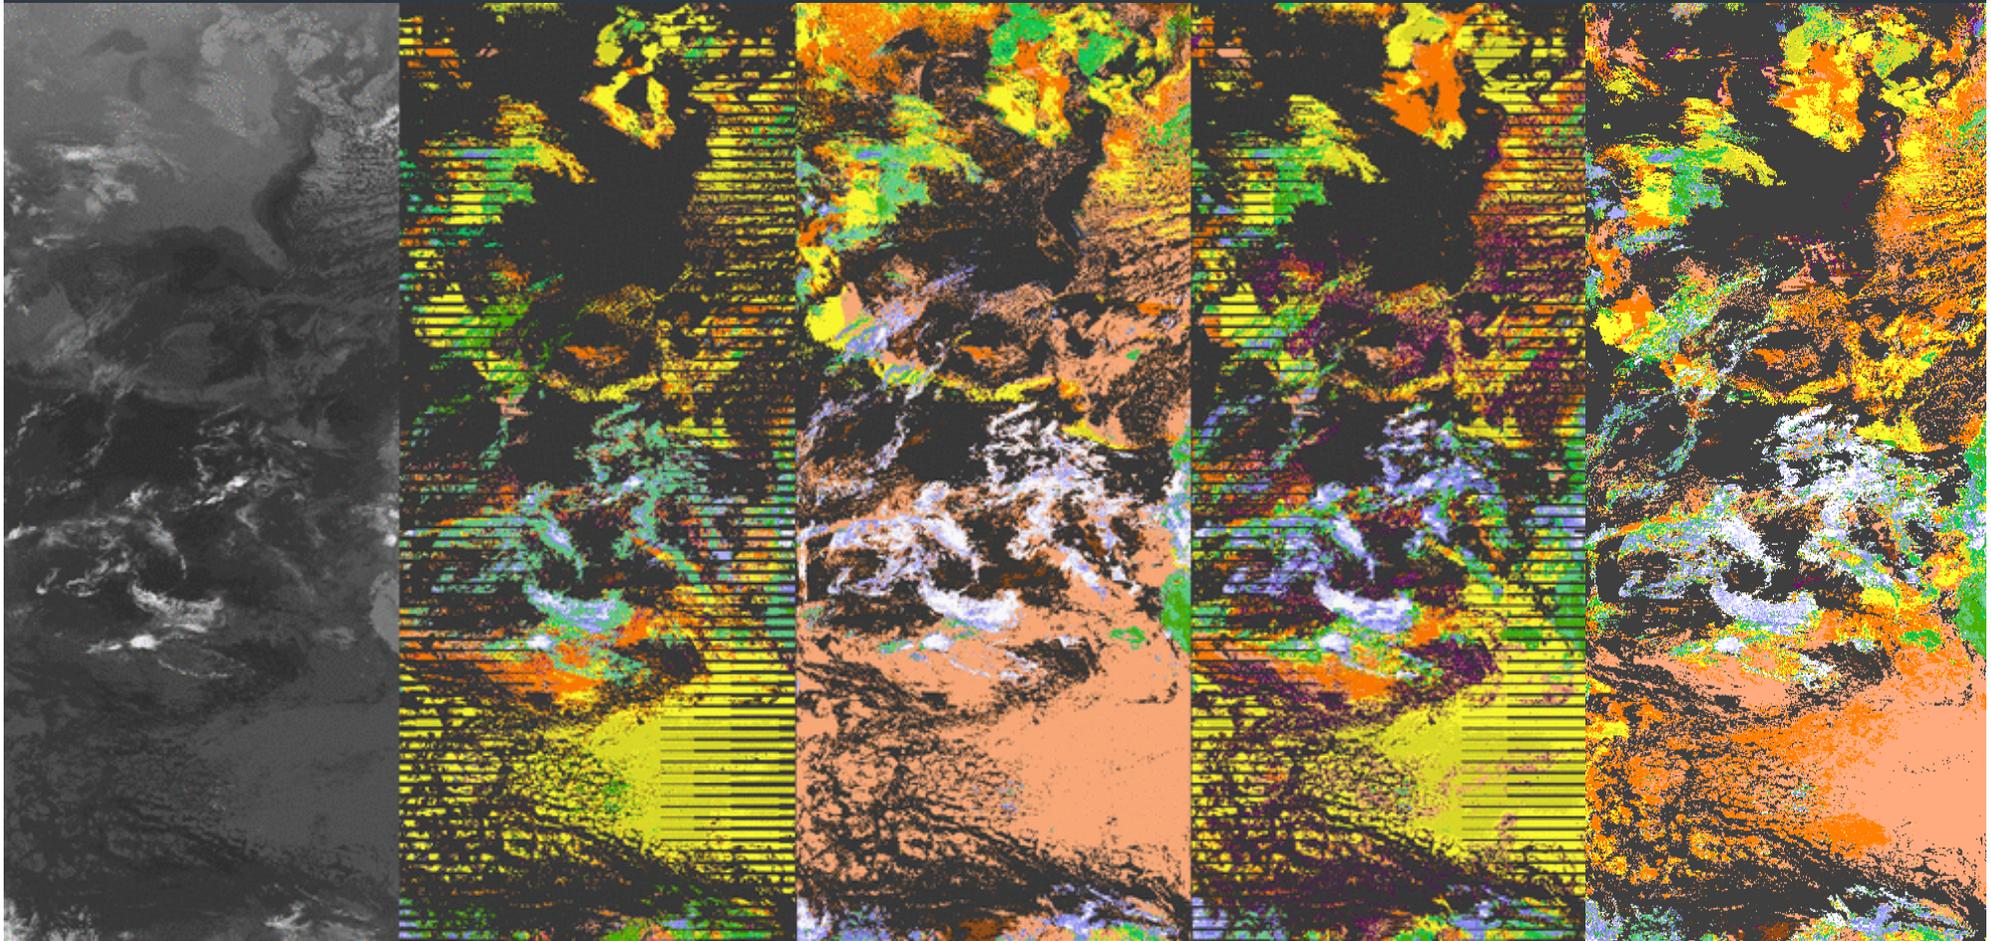

11  $\mu\text{m}$  BT

IDPS

PPS

LARC

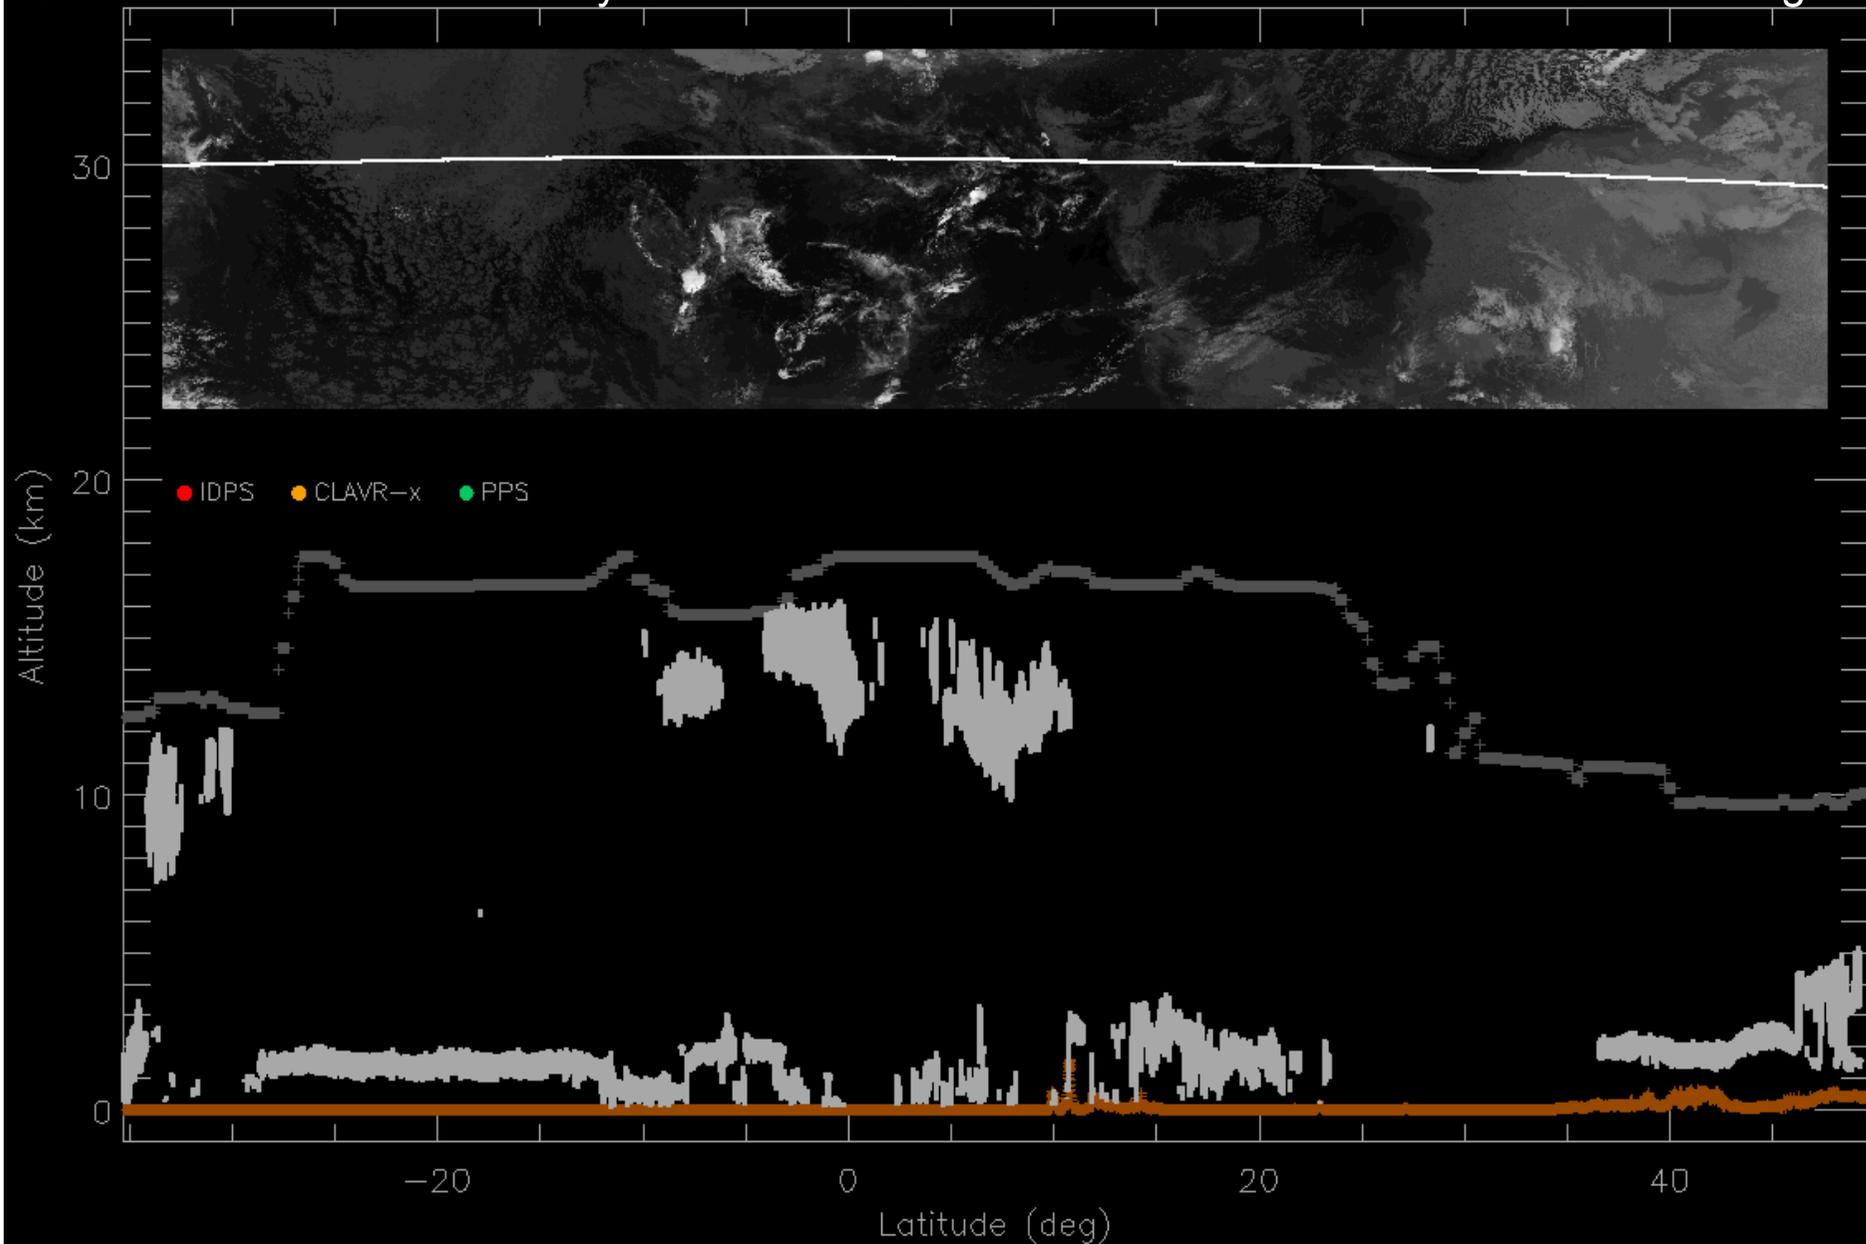

Cloud-top Height (km)

# CALIPSO Comparison 03/29

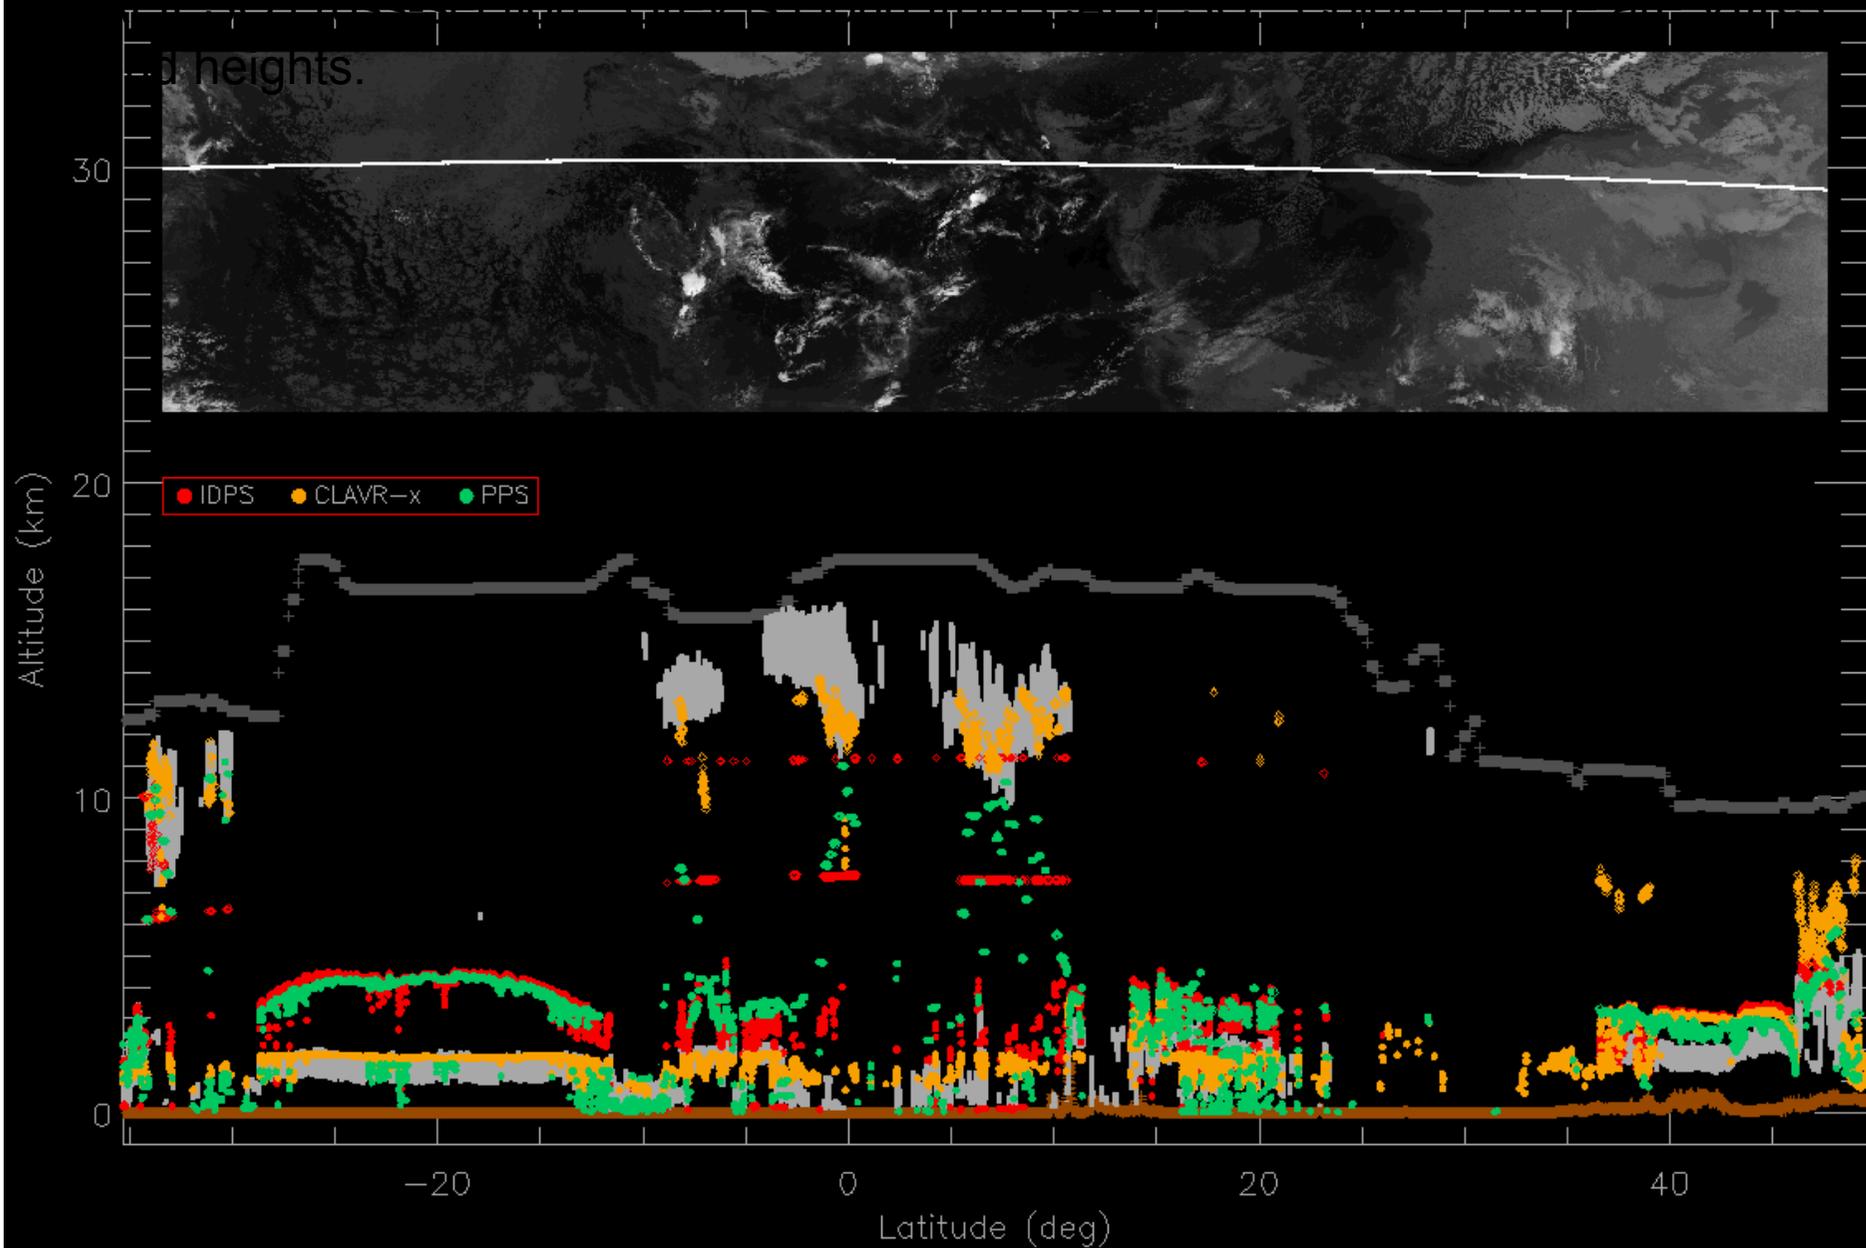

21

CALIPSO cross-section. Grey is cloud from CALIPSO. Colored circle are VIIRS cloud heights.

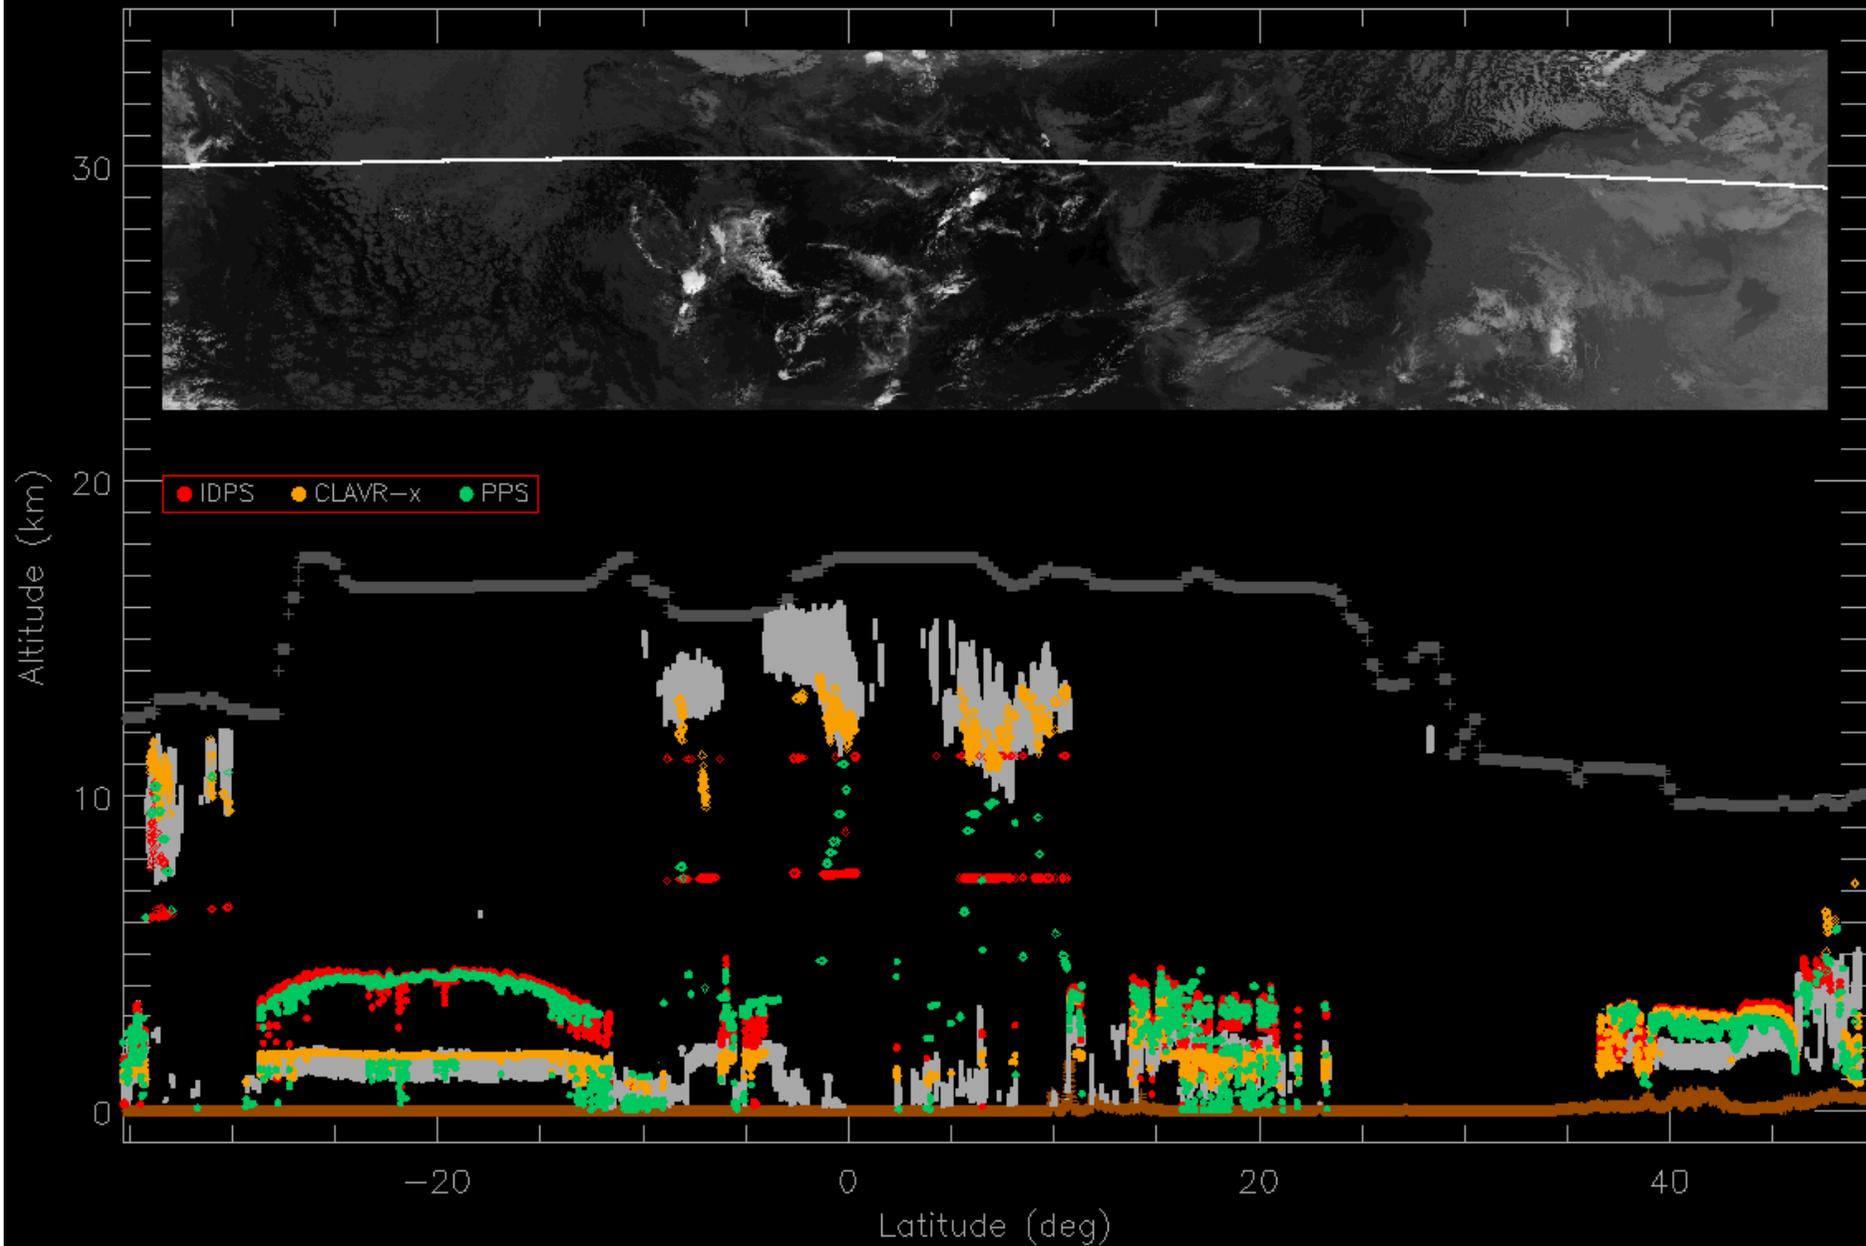

# CALIPSO Comparison 03/29 –No Phase Filter

22

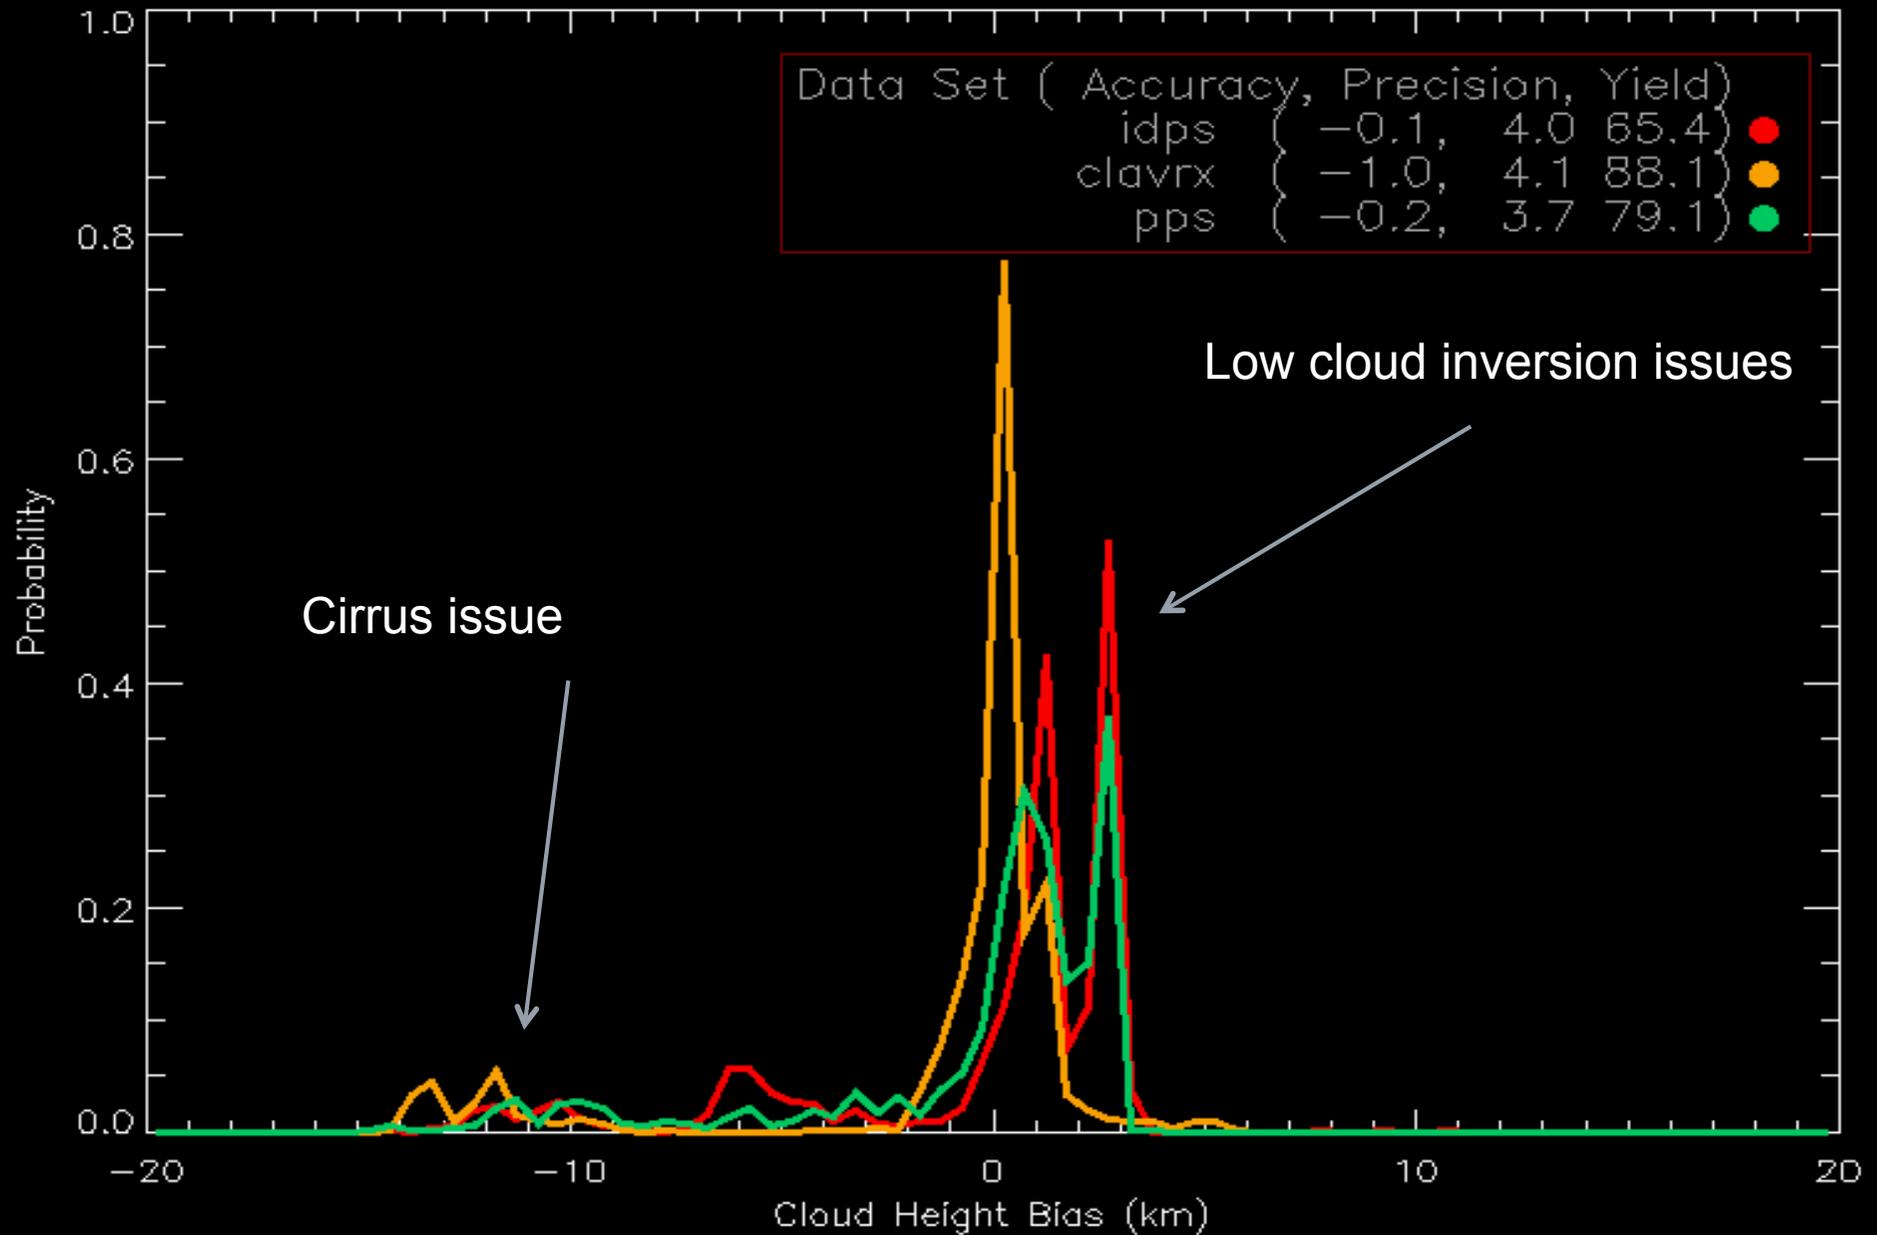

# CALIPSO Comparison 03/29 - Phase Filter

23

# Bias Distribution 03/29 – No Phase Filter

24

# Conclusions

- Thank you for the data!
- If you have VIIRS retrievals (especially for these scenes), please share.
- Issues that plagued the SEVIRI analysis remain.
  - Differences in Cloud Mask and Cloud Phase
  - Cloud optical depth over snow
  - Cloud particle size performance for thin clouds
  - Cloud height performance in complex vertical structures.
